

The various problems that we can still face are:

- 1)The amount of data collected can be very large and if we use normal coding it would not be feasible time-wise to process the data, so we would have to write clever codes which are time efficient.
- 2)There might be some error in the equipment used to measure and we would also have to cancel, for eg., the noise in the data that we have collected.
- 3)Also we would have to convert the data from text format to format which we can easily interpret according to our convenience
